Final code in the branch named Final

Contributions

All members contributed equally to the project and documentation of the progress and necessary files. A rough estimate of each members contribution is Devaansh worked on the code used to graph the data points that resulted from the snakes increasing score, Abigail worked on the code for the agent that was used to make the snake move without user input, and Vanessa worked on the algorithm that allowed the snake to store memory and make progress in its scoring. The team helped each other with their individual parts making it a group effort. To work on the project together we used github, voice calls, and messaging to share code amongst each other, though we encountered challenges using github we found other ways of sharing the code and working together.
